WEATHER FORECAST

To set up and run the Weather Forecast application, follow the steps below:

Prerequisites:

Flutter SDK: Make sure you have Flutter SDK installed on your machine. You can download and install it from the official Flutter website: https://flutter.dev/docs/get-started/install

Setup:

1) Clone the project: Clone the Weather Forecast project to your local machine using Git or download the source code as a ZIP file and extract it.
2) Open the project: Open your preferred IDE or text editor and navigate to the project folder.
3) Get dependencies: Run the following command in the terminal to fetch the project dependencies:

   flutter pub get

Running the Application:

1) Connect a device or start an emulator: Connect a physical device to your computer or start an emulator using Android Studio or the `flutter emulators` command.
2) Launch the application: Run the following command to launch the Weather Forecast application:

   flutter run

3) This command will compile the code and install the app on the connected device or emulator. The application will start automatically.

Make sure you have a stable internet connection for the application to fetch weather data from the API.

That's it! You have successfully set up and run the Weather Forecast application.
